

Palm oil in India is always produced by replacing
previously tilled cultivable land

Indian palm oil is 100% sustainable
No forest is ever touched

We consume palm oil as a major raw material for our oleo chemicals as well as for our soaps business. We also produce Indian palm oil in our Agrovet company. Palm oil in India is produced by small holder plantations which always replace previously tilled cultivable land. It always involves a switchover from a less sustainable agro crop to oil palm. No forest is ever touched. Therefore, Indian palm oil is 100% sustainable though RSPO has yet to recognise this fact and draw up the necessary certification procedure. We also import palm oil products from Malaysia and Indonesia and it is our commitment to switch to consumption of 100% certified palm products by the end of 2020 at the latest. We also source palm products which have been produced from imported palm oil by India-based processors. Their sourcing is not controllable by us but it is our endeavor to work with them so that even such secondary sourced products are RSPO compliant by the end of 2020 at the latest. We acknowledge that considerable progress towards sustainable practice has been made by our suppliers in Malaysia and Indonesia. If for any reason there is found to be breach on their part or if there is found to be any link between palm oil and deforestation, it is our commitment to break such a link. We believe the world needs palm oil but only such palm oil as is produced in a sustainable manner with due regard and concern for fauna and flora.
